Patent No. 5863894

GENERAL INFORMATION:
APPLICANT: George P. Vlasuk, Patric H. Stanssens,
APPLICANT: Joris H.L. Mensens, Marc J. Lauwereys,
APPLICANT: Yves R. Laroche, Laurent S. Jespers,
APPLICANT: Yves R. Laroche, Laurent S. Jespers,
APPLICANT: Yves R. Laroche, Laurent S. Jespers,
APPLICANT: Peter W. Bergum
TITLE OF INVENTION: NEWATODE-EXTRACTED ANTICOAGULANT
TITLE OF INVENTION: PROTEIN
TITLE OF INVENTION: PROTEIN
TITLE OF SEQUENCES: 356
CORRESPONDENES: 356

```
The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (BCMA) activity in a mammal. The method comprises administering a precisic binding partner for APRLL (G70, a tumour necrosis factor-TNF family ligand), having the consensus region of TACI, BCMA, or the TACI/ BCMA actracellular consensus sequence, bur not the extracellular region of TACI and/or BCMA. The method is useful for inhibiting activity of TACI and/or BCMA in a mammal which is useful for treating B-cell or T-cell lymphoproliferative disorders, one or more solid tumours such as lung, astrointestinal, pancreatic or prostate tumour. APRLL, BCMA and TACI antagonists are useful for treating inflammation and immune function diseases such as diarrhoea, psoriasis, allergies, pneumonia, acopic dermatitis, respiratory allergic disease (asthma, hypersensitivity lung disease), drug and insect sting allergy, inflammatory bowel disease (Crohn s disease, colitis), sclerodermi, autoimmune disease (mittiple sclerosis, rheumatoid arthritis, systemic lupus erythematosus), fungal, bacterial, protozoal and viral infections (HIV), atherosclerosis, cancer with leucocyte infilitation of the skin or organs. The present sequence with a protozoal and viral infections from the present sequence or the sequence of the standard and the standard and the sequence or the sequence o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The invention provides novel tumor necrosis factor receptor zinfild polynuclectides ADZ67753 and polypeptides ADZ67754, expression vectors and antibodies. Zinfild polynuclectides are used in claimed methods for detecting a genetic abnormality in a patient and for detecting a cancer in a patient. Recombinant zinfild polypeptide, optionally conjugated to a toxin, is used in a claimed method of killing cancer cells. Zinfild polypeptides can be used to detect ligands, agonists and antagonists. The polypeptides, polynucleotides and antibodies may also be used in methods that modulate tumor growth, metastasis, and immunity such as separating resting from stimulated immune cells. The present sequence is that of the Cysrzich domain of human TUNE BUMA ADZ67760. This sequence was compared with that of zinfild in the identification of zinfild as a member of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 40 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel TALL-1 antagonist protein, comprising a sequence that differs from SEO ID NO:2, or amino acids 134-285 of SEO ID NO:2, by at least one modification in the region connecting &bgr; strands or and E that reduces the biological activity of the TALL-1 antagonist as compared to wild-type TALL-1. A protein of the invention has immunosuppressive, antitheumatic, antithialmancory, antiathritic, dermatological, antidiabetic, neuroprotective, antiathyroid, antipyretic, nephrotropic, and vasotropic activity. A TALL-1 antagonist may be used in a vaccine. A protein of the invention is useful for inhibiting TALL-1 biological activity in a mammal. TC is useful for inhibiting TALL-1 chickles are remmatorid arthritis, systemic lupus erythematosus, insulin dependent diabetes mellitus, multiple sclerosis, myasthaenia gravis, Grave's disease, autoimmune hemolytic anaemia, autoimmune thromatoric purpura, Goodpasture's syndrome, pemphigus vulgaris, cutte rheumatic fever, post-serreptococcal glomerulonephritis and coldmann (CRD) module of human BCMA.

The polypeptides inhibit APRIL or BAFF binding to B-cell maturation antigen (BCWA). APRIL and BAFF are tumor necrosis family (TNF) members. The polypeptides of the invention are useful for treating immune-related diseases, such as rheumatoid arthritis, multiple sclerosis, and systemic lupus erythematosus; cancer such as leukemia, lymphoma, or multiple sclerows; or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and inflammation. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                용
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (BCMA) activity in a mammal. The method comprises administering a precific binding partner for APRLI (G70, a tumour necrosis factor-TNF family ligand), having the consensus region of TACI, BCMA, or the TACI/ BCMA extracellular consensus sequence, but not the extracellular region of TACI and/or BCMA in amammal which is useful for inhibiting activity of TACI and/or BCMA. The method is useful for inhibiting activity of TACI and/or BCMA in amammal which is useful for treating B-cell or T-cell lymphoproliferative disorders, one or more solid tumours such as lung, astronates are useful for treating inflammation and immune function diseases such as diarrhoea, psoriasis, alergies, pneumonia, atopic dermatities, respiratory allergic disease (satham, hypersensitivity lung disease), drug and insect sting allergy, inflammatory bowel disease (crohn's disease, colitis), soleroderma, autoimmune disease (multiple solerial, protozoal and viral infections (HIV), atherosclerosis, cancer with leucocyte infiltration of the skin or organs. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                               Inhibiting activity of B cell maturation protein and/or transmembrane activator and intracellular cyclophilin ligand interactor, by administering a binding partner for APRIL, a tumor necrosis factor family
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            APRIL; BAPF; immune disorder; immunomodulator; antiinflammatory; cancer; cytostatic; neoplasm; immunosuppressive; therapeutic; B-cell maturation antigen; BCMA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                          The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (BCMA) activity in a mammal. The method comprises administering a pecific binding partner for APRIL (G70, a tumour necrosis factor-INF family ligand), having the consensus region of TACI, BCMA, or the TACI GMA extracellular consensus sequence, but not the extracellular region of TACI or BCMA. The method is useful for inhibiting activity of TACI and/or BCMA, in a mammal which is useful for treating B-cell or T-cell lymphoproliferative disorders, one or more solid tumours such as lung, gastrointesitnal, pancreatic or prostate tumour. ARRIL, BCMA and TACI antagonists are useful for treating inflammation and immune function diseases such as diarrhoea, psoriasis, allergies, pneumonia, atopic dermatitis, respiratory allergic disease (asthma, hypersensitivity lung disease), drug and insect sting allergy, inflammatory bowel disease (Crohn's disease, colitis), scleroderma, autoimmune disease (multiple sclerosis, rheumarcid arthritis, systemic lupus erythematosus), fungal, bacterial, protozoal and viral infections (HIV), atherosclerosis, cancer with leucocyte infiltration of the skin or organs. The present sequence is human BCMA cysteine-rich extracellular region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (BCMA) activity in a mammal. The method comprises administering a specific binding partner for APRLL (GTO, a tumour necrosis factor-TNF family ligand), having the consensus region of TACI, BCMA, or the TACI/ BCMA extracellular region of TACI activity of the TACI/ BCMA. The method is useful for inhibiting activity of TACI and/or BCMA. The method is useful for inhibiting activity of TACI and/or BCMA in amammal which is useful for treating B-cell or T-cell lymphoproliferative disorders, one or more solid tumours such as lung, gastrointestinal, pancreatic or prostate tumour. APRIL, BCMA and TACI antagonists are useful for treating inflammation and immune function diseases such as diarrhoea, psoriasis, allergies, pneumonia, atopic dermatities, respiratory allergic disease (asthma, hypersensitivity ung disease), drug and insect sting allergy, inflammatory bowel disease (Crohn's disease, colitis), scleroderma, autoimmune disease (multiple sclerosis, thematoid arthritis, systemic lupus erythematosus), fungal, bacterial, protozoal and viral infections (HIV), atherosclerosis, cancer with leucocyte infiltration of the skin or organs. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
Inhibiting activity of B cell maturation protein and/or transmembrane activator and intracellular cyclophilin ligand interactor, by administering a binding partner for APRIL, a tumor necrosis factor family
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        BCWA, necrosis factor-kB activator, NF-kB, gene expression, cancer; anti-cell death gene; apoptosis, viral infection; inflammatory response; rheumatoid arthritis; inflammatory bowel disease; septic shock.

```
The present sequence represents a BCWA (not defined) polypeptide. BCWA is a necrosis factor (NF)-kB activator. The method of the invention is used to identify compounds which modulate BCWA activity (and thus NF-kB activity compounds which modulate BCMA activity dand thus NF-kB activity. The specification describes a method of identifying a lorease gene expression from a promoter. The method involves contacting a library of with a cell which expresses a recombinant anti-cell death gene and a reporter gene operably linked to the promoter, and then determining whether the expression of the reporter gene is altered as a result of contact with library. The method is useful for indentifying polypeptides which increase or decrease gene expression from a pramaceutical composition for treating cancer, apoptosis, viral infections, inflammatory response, such as rheumatoid arthitis, inflammatory bowel disease or septic shock. BCMA is useful for identifying compounds that modulate NF-kB expression and thus for drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       transmembrane activator and CAML-interactor; tumour necrosis factor; rNF; ztnf4 activity; antibody production; autoimmune disease; amyloidosis; systemic lupus erythematosus; mysthemia gravis; multiple sclerosis; rheumatoid arthritis; asthms, bronchitis; emphysema; pyelonephritis; end stage renal failure; glomerulonephritis; vasculitis; nephritis; renal neoplasm; multiple myeloma; lymphoma; light chain neuropath; immunosuppression; graft rejection; joint pain; graft versus host disease; inflammation; swelling; anaemia; septic shock; insulin dependent diabetes mellitus; Crohn's disease; hypertension; renal artery stenosis; occlusion; cholesterol; renal emboli.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; BR43x2; TACI receptor; extracellular domain; BCMA; B cell protein;
                                                                                                                                                                                                                                                                               Identifying a modulator of gene expression for drug designing, by contacting a compound library with a cell expressing an anti-cell death gene and reporter gene, and determining alteration in reporter gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Length 184;

The present sequence represents a human BCMA protein, a B cell protein related to transmembrane activator and CAMI-interactor (TACI) receptor. Traci is a tumour necrosis factor (TARI) receptor. The extracellular domains of BR43x2 (an isoform of TACI). TACI or BCMA (a related B cell protein) receptor contain a cysteline rich domain, and are used for protein receptor contain a cysteline rich domain, and are used for inhibiting ztiff a activity. Ztiff is a TYR ligand. They may also be used for inhibiting stiff a cities a BCMA receptor-ligand engagement associated with activated or resting B lymphocytes, effector T-cells, or with activated or resting B lymphocytes, effector T-cells, or with antibody production. The antibody production is associated with an autoimmune disease selected from systemic lupus erythematosus, myasthenia gravis, multiple sclerosis and rheumatoid arthritis. The ztiff a cities activity and Stax2, TACI or BCMA receptor-ligand engagement is associated with cashma, bronchitis, emphysems, enghysems, nephritis, nephritis, pyelonephritis, renal complasms, multiple myelomas, lymphomas, light chain neuropathy, amplement of any production, graft versus host disease, inflammation, insulin dependent rejection, graft versus host disease, inflammation, insulin dependent conference smellitus, Crohn's disease, joint pain, swelling, and engage conference agonists or antagonists can be used to treat hypertension, renal artery constants, or ceptic shock. BR43x2, TACI, and BCMA polypeptides, fusions, antibodies, stenosis, or occlusion, and cholesterol or renal emboli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, TNF, tumour necrosis factor; TALL-1; APRIL; TNF receptor; TNFR; TACL; BCMA; therapy; cancer; leukaemia; myeloma; lymphoma; autoimmune disease; rheumatoid arthritis; multiple sclerosis; psoriasis.
                                                                                                                                                                                                                                                                                                                      Inhibiting ztnf4 activity in a mammal, to treat autoimmune diseases, renal disease, graft versus host disease, and inflammation, comprises administering a BR43x2, TACI or BCMA extracellular domain polypeptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to methods of using one or more agonists or antagonists to modulate the activity of the members of TNF (tumour necrosis factor) especially TALL-1, APRIL and TNF receptor (TNFR) e.g. TACI or BCMA. The method is useful for treating pathological conditions or diseases associated with increased TALL-1 and APRIL expression or between APRIL and APRIL antagonists are used to block the interaction between APRIL and TALL-1 with TACI or BCMA. They are useful for treating a mammal suffering from cancer such as leukaemia, lymphoma, myeloma, architis, multiple solon and autocimmune diseases e.g. rheumatoid arthitis, multiple solerosis, psoriasis and lupus erythematosus. The present sequence is human BCMA protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; Tumour Necrosis Factor; TNF; immunosuppressant; TALL-1; Tumour necrosis factor and ApoL-related Leucocyte expressed Ligand 1; therapy; autoimmune disorder; rheumatoid arthritis; multiple sclerosis; systemic lupus erythematosus; SLE; insulin dependent diabetes mellitus; thrombocytopenia purpura; acute rheumatic fever; Goodpasture's syndrome; hamemolytic ansemia; Grave's disease; mysathenia gravis; chromosome 16; post-streptococcal glomerulonephitis; polyarteritis nodosa; BCWA; B cell maturation factor; pemphigus vulgaris; B-lymphocyte proliferation.

The present invention retails actor (1781). Incleic acid molecules, crime present invention in the present invention in proteins (including homologues), and their antibodies. The invention in particular relates to methods for regularing the interaction between Table of particular relates to methods for regularing the interaction between Table of regulare monocyte, macrophage and B lymphocyte mediated immune responses. Table 1 protein is useful for identifying compounds that regulare B components is useful for identifying compounds that regulare B lymphocyte proliferation. It is also useful for treating B lymphocyte associated autoimmune disorders like rheumatoid arthritis, systemic lupus crythematosus (SLE), insulin dependent diabetes mellitus, multiple solerosis, mysathenia gravis, Grave's disease, autoimmune haemolytic anemaia, autoimmune thrombocytopenia purpura, Goodpasture's syndrome, pemphigus vulgaris, acute rheumatic fever, post-streptococcal glomerulonephritis, or polyarteritis nodosa. The Table 1 protein and its corresponding nucleic acid sequence are also useful in diagnostic assays. The present sequence is a human B cell maturation factor (BCMA) protein. The present sequence is a human B cell maturation factor (BCMA) protein. It is the receptor for Table 1 protein. BCMA gene is located on chromosome CC in tis usecle, heart, lung, kidney, pancreas, testis and placenta. BCMA mann in the pro-B lymphocyte stage but its expression increases with B lymphocyte maturation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to the use of a BAFF receptor (BAFF-R, also known as BCMA) protein, or a BAFF-R fusion protein as an agent for the as BCMA) protein, or a BAFF-R fusion protein as an agent for the creatment of a variety of immune-related disorders. BAFF-R is a member of the TNF (tumour necrosis factor) family, acting as an immunoregulatory capent, and also plays a role in the development of hypertension and containing it, and BAFF-R. Specific antibodies can be used for inhibiting B-cell growth, dendritic call-induced B-cell growth and maturation, and immunoglobulin production, and in the treatment of autoimmune disorders. The BAFF-R proteins may also condition, and in the treatment of immunosuppressive disorders and HIV conteins or BAFF-R specific antibodies may be used for treating, pathway suppressing or altering an immune response involving a signalling pathway contained and maturation in the treating diseases inhibits B-cell growth and maturation it is useful for treating diseases such as systemic lupus erythemacous, autoimmune haemolytic anaemia, capenoses in which as glomerulonephritis, and lymphomas. the invention tractes to a merinou of treating a mominal tota condition.

Sesociated with undesired cell proliferation such as cancer or carcinoma. The method involves administering a composition comprising A proliferation Inducing Ligand Receptor (APRIL-R) also referred as B cell meturation protein (BFW or BCMA) antagonist that antagonises the interaction between APRIL and its cognate receptor(s). This method is interaction between APRIL and its cognate receptor(s). This method is carcinoma e.g. human lung carcinoma, colon carcinoma, breast carcinoma, carcinoma, and other carcinomas whose proliferation is modulated by APRIL. It is also useful for treating autoimmune diseases (Grave's disease, systematic lupus erythematous-EBP); hypertension, cardiovascular diseases, systematic lupus erythematous-EBP; hypertension, cardiovascular diseases, systematic services and for treating autoimmune diseases, cardiovascular immunosuppressive diseases, organ transplantation, inflammation and human immune response involving a signalling pathway between APRIL-R and its lighand. APRIL-R DNA is also useful in gene therapy. The present sequence is human APRIL-R also referred as BCMA or BCM protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Treating a mammal for a condition associated with undesired cell proliferation such as cancer or carcinoma, comprises administering a composition comprising A Proliferation Inducing Ligand Receptor (APRIL-R)
systemic lupus erythematosus; SLE; inflammation; cardiovascular disease; B-cell lympho-proliferative disorder; BCM; immunosuppressive disease; organ transplantation; HIV; human immunodeficiency virus; TNF; tumour necrosis factor; BCMA; B cell maturation protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of treating a mammal for a condition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; Ztnfr12; tumour necrosis factor receptor; cytostatic; immunosuppressive; dermatological; antiinflammatory; antidiabetic;

Metastatic colorectal cancer-associated polypeptide.

(first entry)

30-DEC-2002

```
The present invention describes a human tumour necrosis factor receptor designated Zthff12 [1]. [1] has cytostatic, immunosuppressive, dermathological, antiinflammatory, neuroprotective, antidiabetic, antinflammatory, neuroprotective, antidiabetic, antinflammatory, neuroprotective, antidiabetic, antisthmatic, nephrotropic and hypotensive activities, and can be used in gene therapy. [1] can be used for inhibiting, in a mammal, the activity of a ligand that binds Zthf12 (e.g. ZTNF4), for treating disorders and diseases associated with B lymphocytes, activated B lymphocytes or resting B lymphocytes, and for inhibiting the proliferation of tumour calls. [1] is useful for treating autoimmune disorders such as systemic lupus erythematosus, myasthenia gravis, multiple sclerosis, insulin dependent diabetes mellitus, asthma, rheumatoid arthritis, bronchitis, emphysema and end stage renal failure or renal disease such as glomerulonephritis, vasculitis, chronic lymphoid leukaemia, nephritis, and pyelonephritis, and for treating renal neoplasms, multiple myelomas, lymphomas, light chain neuropathy, or amyloidosis, hypertension, large vessel disease, graft rejection and Crohn's disease, such and crohn's disease and characterized and crohn's disease and construction the immune system for requiating B cell responses and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel isolated human tumor necrosis factor receptor polypeptide, termed Ztnfr 12, useful for treating autoimmune disorders, emphysema, end stage renal failure or renal disease and lymphoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               development, for modulating development of other cells, antibody production and cytokine production, and for modulating T and B cell communication. The present sequence represents a protein which is given in the exemplification of the present invention

The present sequence is the protein sequence of a human polypeptide encoded by a gene that exhibits decreased expression in colon cancerderived metastases compared to normal colon tissue. It is an example of claimed polypeptides that are encoded by genes which are differentially expressed in metastatic colorectal cancer cells. Such polypeptides are useful in diagnostic and prognostic assays, for raising antibodies are e.g. in immunotherapy, and in screening for modulator compounds of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, tumour, B-cell maturation antigen, transmembrane activator; calcium-modulator; cyclophilin ligand-interactor; TAC1; gene therapy; neoplasm; chronic lymphocytic leukaemia; lymphoproliferative dieasse; non-Hodgkin's lymphoma; light chain gammopathy; inflammation; asthma;

The invention relates to fusion proteins comprising transmembrane activator and calcium modulator and cyclophilin ligand-interactor (TACI) receptor group that binds tumour necrosis factor-like protein (ZINF) 2 or INF4; and an immunoglobulin group comprising a constant region of an immunoglobulin. The invention is used to manufacture a medicament for inhibiting the proliferation of tumour cells in a mammalian subject. The composition comprising the fusion protein may also be used in treating autoimmune diseases (e.g. systemic lupus erythematosus, multiple sclerosis, diabetes mellitus, rheumatoid arthritis and asthma), renal diseases (e.g. glomerulonephritis), bronchitis, inflammation, graft ejection, anaemia and septic shock. The fusion proteins are also used in gene, therapy, The present sequence is human B-cell maturation receptor
                                                                                                                                                                                                                                                                               Transmembrane activator and calcium modulator and cyclophilin ligand-
interactor (TACI)-immunoglobulin fusion protein, for treating cancer or
diabetes, comprises a TACI receptor group and an immunoglobulin group.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to the manufacture of a composition for inhibiting the proliferation of tumour cells. The method involves using an antibody component that binds both the B-cell maturation antigen (BCMA) and the transmembrane activator and calcium-modulator and cyclophilin ligand-interactor (TACI). BCMA and TACI binding antibody compositions are useful for inhibiting proliferation of tumour cells, particularly inhibiting production or a disorder consisting of neoplasm, chronic lymphocycic production or a disorder consisting of neoplasm, chronic lymphocycic lymphoproliferative disease or light chain gammopathy or inflammation lymphoproliferative disease or light chain gammopathy or inflammation e.g. asthma. The invention is also useful in gene therapy. The present is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to the use of an agonist or antagonist of Genoxit activity for preventing or treating obesity. Genoxit is a member of the Tumour Necrosis Factor Receptor Super Family and is a Type III transmembrane protein. The agonists or antagonists of the invention are useful for treating or preventing obesity-related diseases or disorders, e.g. obesity, insulin resistance, atherosclerosis, atheromatrous disease, heart disease (e.g. cardiac insufficiency, coronary insufficiency, high blood pressure), hypertension, stroke, syndrome X, diabetes mellitus (complications, e.g. microangiopathic lesions, ocular lesions, cular lesions, retinopathy, neuropathy and renal lesions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New use of agonist or antagonist of Genoxit activity for preventing or treating obesity-related diseases or disorders, e.g. hyperlipidemia and atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            100.0%; Score 201; DB 6;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ABP60552
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel TALL-1 antagonist protein, comprising a sequence that differs from SEQ ID NO:2, or amino acids 134-285 of SEQ ID NO:2, by at least one modification in the region connecting &bgr; strands CD and E that reduces the biological activity of the TALL-1 antagonist as compared to wild-type TALL-1. A protein of the invention has immunosuppressive, antirheumatic, antiinflammatory, antiarhitic, dermatological, antidabetic, neurotective, altithyroid, antipyretic, nephrotropic, and vasotropic activity. A TALL-1 antagonist may be used in a vaccine. A protein of the invention is useful for inhibiting TALL-1 a vaccine. A protein of the invention is useful for inhibiting TALL-1 considers in the invention at useful for inhibiting TALL-1 andependent diabetes mellitus, multiple sclerosis, myasthaenia gravis, dependent diabetes mellitus, multiple sclerosis, myasthaenia gravis, crimcombocytopenic purpura, Goodpasture's syndrome, pemphigus vulgaris, acute rheumatic fever, post-streptococcal glomerulonephitis and acute rheumatic fever, post-streptococcal glomerulonephitis and collaborate in the present sequence represents human BCMA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; genoxit; anorectic; antilipaemic; antiarteriosclerotic; cardiant; antidiabetic; hypotensive; ophthalmological; neuroprotective; nephrotropic; obseity; Tumour Necrosis Factor Receptor Super Family; Type III transmembrane protein; insulin resistance; atherosclerosis; atheromatous disease; heart disease; hypertension; stroke; syndrome X; diabetes mellitus; hyperlipidaemia; hyperuricaemia.
                                                                                                                                                                                                                                                                                                                                                                                             Novel TALL-1 antagonist protein useful for inhibiting TALL- 1 biological activity in mammal, has a modification in the region connecting beta strands D and E that reduces the biological activity of TALL-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present sequence represents a human BCMA polypeptide. The specification also describes TACI and BR3 polypeptides. TACI and BR3 are receptors. Tumour necrosis factor (TNP) family ligands TALL-1 and April bind to the TACI receptor, while TNF family ligands TALL-1 also binds to BR3 receptor. The TACI and BR3 receptor nucleic acid is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  haematological malignancy; immunoconjugate; cytostatic; immunostimulant; vaccine; immunotherapy; cancer; multiple myeloma cell; chronic lymphocytic leukaemia; B cell leukaemia; lymphoma; anti-cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New hematological malignancy-related genes and polypeptides, useful for screening anti-cancer agents, and generating antibodies or immunoconjugates for treating e.g. multiple myeloma cell or chronic
                                                                                                                                                                                                                                                                                                                                              New nucleic acid encoding a TACIs or BR3 polypeptide, useful for
preparing a composition for treating systemic lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               preparing a composition for treating systemic lupus erythematosus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel antibody or its fragment, which immunospecifically binds tumour necrosis factor Delta (TNF-delta/APRIL).

The antibody of the invention has dermatological, immunosuppressive, antiallergic, antiatharthic, cytostatic, antianaemic, antiallarthritic, cytostatic, antianaemic, antiallarthritic, cytostatic, antianaemic, antiallarthritic, antistally, and haemostatic activity.

The antibody or its fragment are useful for treating, preventing or ameliorating cancer such as autoimmune disease, and graft versus concertion of antistally prognosing, treating, preventing or erythematool arthritis or Sjogren's syntamome. The antibody is useful for detecting, diagnosing, prognosing, treating, preventing or ameliorating adisease or disorders ancolosing, treating, preventing or ameliorating adisease or disorders includes autoimmune and inflammatory disorders such as autoimmune neutropenia, haemolytic anaemia, dermatitis, asthma, allergic encephalomyelitis, myccarditis, multiple solerosis, or uveitis, multiple solerosis, diabetes mellitus, psoriasis, cancer of the immune system, particularly B call cancers, immunedficiency syndrome (ADDS), and infectious diseases (e.g. laukemia). The present sequence represents equired immunodeficiency syndrome (ADDS), and proliferative disorders (e.g. acquired immunodeficiency syndrome (ADDS)), and proliferative disorders (e.g. acquired immunodeficiency syndrome (ADDS)), and the tumour necrosis factor BCMA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                            Novel isolated antibody that immunospecifically binds tumor necrosis factor delta, useful for treating, preventing or ameliorating Non-Hodgkin's lymphoma, multiple myeloma, rheumatoid arthritis or Sjogren's

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                     The present invention describes an isolated polymucleotide (I), which is overexpressed in haematological malignancies, and which encodes a colymposition or an immunogenic fragment of the polympositie. Also described: (1) an isolated polympositie; (2) an expression vector described: (1) an isolated polympositie; (2) an expression vector comprising an expression vector; (4) an isolated antibody that perfect ones cell comprising an expression vector; (4) an isolated antibody that specifically binds to the polympositie or its immunogenic fragment; and (5) immunoconjugates comprising the antibody above, or an antibody that specifically binds to a polympositie or its immunogenic fragment, encoded by (1). (1) has cytostatic and immunostimulant activities, and can be used in vaccines and immunotherapy. The immunoconjugates are useful in composition for treating cancer, e.g. multiple myeloma cell, chronic composition for treating cancer, e.g. multiple myeloma cell, chronic lymphocytic leukaemia, B cell leukaemias, or lymphomas in humans, sheep, or immunoconicotide (1) or polypeptide can be used for screening anti-cranted agents, and generating antibodies or immunoconjugates for treating corposition the above-mentioned diseases. The polymucleotide, contracting antibody can be used for detecting, diagnosing or prognosticating the above-mentioned diseases. The polymucleotide, prognosticating the haemaclological malignancies described above. The prognosticating the haemaclological halps and the prognosticating the prognosticating the prognosti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             human, neurodegenerative immunological disorder, demyelination,
Central Nervous System, CNS, inflammation, B-cell maturation antigen,

             immunological disorder, demyelination or Central Nervous System (CNS) inflammation in a mammal. The method comprises administering B-cell maturation antigen (BCMA), or an antibody against BCMA or a BCMA ligand (the mammal has or is at risk of developing multiple sclerosis). The method of the invention has neuroprotective, nootropic, and antilniflammatory activity, and may have a use in gene therapy. The methods, BCMA, and antibodies are useful for treating a neurodegenerative immunological disorder such as multiple sclerosis, demyelination or CNS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and
relates to a novel method for treating a neurodegenerative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to an isolated monoclonal antibody which binds to a transmembrane activator of and CAML interactor (TACI) receptor. The TACI antibodies are useful for modulating TALL-1 or TACI polypeptide biological activity in mammalian cells, or for diagnosing arreating pathological conditions associated with TNF and TNF receptorrelated molecules, e.g. cancer or immune-related disease, such as systemic lupus erythematosus, rheumatoid arthritis, Sjogren's syndrome, systemic vasculitis, diabbetes mellitus, Crohn's disease, such as gyatemic vasculitis, multiple sclerosis, psoriasis, asthma, urticaria or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   protein conjugate of the invention. The neutrokine-alpha protein conjugate of the invention. The neutrokine-alpha protein conjugate comprises neutrokine-alpha protein and chelator, where the neutrokine-alpha protein (also known as B-lymphocyte stimulator (BLyS), TALL-1, THANK and BAFF) is capable of binding neutrokine-alpha receptor and is selected from full length or mature neutrokine-alpha protein. The protein conjugate of the invention is useful in a complex with a metal ion associated with the chelator which is useful for administering radiotherapy to a subject such as human who is in need of radiotherapy, which involves administering the complex to the subject, where it is administered as an injectable solution, and the subject has a B-cell mediated disease. The subject has a condition chosen from non-Hodgkin's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           lymphoma, chronic lymphocytic leukaemia, multiple myeloma, systemic lupus

c erythematosus, rheumatoid arthritis, multiple sclerosis, Crohn's disease, diabetes, Wegener's granulomatosis, myasthenia gravis and asthma, correlarably non-Hodgkin's lymphoma. The complex is useful for treating cancer, which involves administering it to a subject haring cancer, where cancer expresses a neutrokine-alpha receptor on its a call of the cancer expresses a neutrokine-alpha receptor on its surface. The cancer is a B cell cancer, which is chosen from non-Hodgkin's lymphoma, multiple myeloma and chronic lymphocytic leukaemia. The complex is also useful for treating an autoimmune disease or disorder, chosen from systemic lupus erythematosus, rheumatoid arthritis and Sjoaren's syndrome. The complex may also be used for diagnostic useful for killing a cell chosen from a cell bearing a neutrokine-alpha useful for killing a cell chosen from a cell bearing a neutrokine-alpha caepara cancerting an early bearing an entrokine-alpha capha receptor, which involves contacting the cell with the composition to kill the cell. The cell is lymphocyte, B cell or cancerous cell that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

isolated PRO polypeptide; (5) a chimeric molecule comprising the isolated PRO polypeptide; (5) a chimeric molecule comprising the polypeptide of (4) fused to a heterologous amino acid sequence; (6) an antibody which specifically binds to a polypeptide of (4); (7) a composition of matter comprising a polypeptide of (4); (7) a composition of matter comprising a polypeptide of (4); (7) a antagonist of the polypeptide or an antibody that binds to the polypeptide or an article of manufacture comprising a container, a label on the container and a composition of matter of (7); (9) a method of treating an immune related disease in a mammal; (10) a method for determining the presence of a PRO polypeptide of a mammal; (10) a method of identifying a compound that inhibits or manufact the activity of or expression of a gene encoding a PRO polypeptide in mammal; (12) a method of identifying a compound that inhibits or manufact the activity of or expression of a gene encoding a PRO polypeptide; and (13) a method of esimulating the immune response in a mammal. The PRO sequences have antialleric, antialnaemic, antialpeoriatic, antialnaemic, antialpeoriatic, antialnaemic, antialpeoriatic, antialnaemic, antialpeoriatic, antialnaemic, antialpeoriatic, antialpeoriatic, respiratory, vasotropic and virucide activities, and can be used in gene therapy. The nucleic acid (1) and the encoded polypeptides, compositions, kits and methods are useful in diagnosing and treating an immune response and in estimulating an immune response. The present sequence represents a human properior.

PRO protein from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                  The invention comprises a method of depleting B cells from a mixed population of cells, the method involves contacting the mixed population of cells with BLyS antagonist (e.g. an immunoadhesin) and a CD20 binding antibody (e.g. hu2H7.v16). The method of the invention is useful for treating B cell malignancies and autoimmune disorders, such as: non-Hodgkin's lymphocytic leukemia, Hodgkin's disease, follicular center cell lymphomas, lymphocytic leukemia, Hairy call leukemia, rheumatoid arthritis, systemic lupus erythematosus, Wegener's disease, inflammatory bowel disease, inflammatory bowel disease, psoriasis, 1gA nephropathy, myssthenia gravis, vasculitis, asthma, glomerulonephritis. The present amino acid sequence represents a human
                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New tumor necrosis factor receptor (TNFR) polypeptides, useful as detecting ligands, and for modulating tumor growth, metastasis and immunity, such as separating resting from stimulated immune cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Tumor necrosis factor receptor; BCMA; cancer; neoplasm; diagnosis;
                                                     Depleting B cells from a mixed population of cells by contacting cells with a BLyS antagonist and a CD20 binding antibody, useful treating B cell malignancies and autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The invention provides novel tumor necrosis factor receptor ztnfr14 polynucleotides ADZ67754, expression vectors and antibodies. Ztnff14 polynucleotides are used in claimed methods for detecting a cancer in a patient. Recombinant ztnff14 polypeptide, optionally conjugated to a toxin, is used in a claimed method of killing cancer cells. Ztnff14 polypeptides, optionally conjugated to a polypeptides can be used to detect ligands, agonists and antagonists. The polypeptides, polynucleotides and antibodies may also be used in methods that modulate tumor growth, metastasis, and immunity such as separating resting from stimulated immune cells. The present sequence is that of human TNPR BCMA. This sequence was compared with that of ztnff14 in the identification of ztnff14 as a member of the TNPR family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a method of inhibiting the growth of a cell that expresses a protein comprising contacting the cell with an antibody, oligopeptide or organic molecule that binds to the protein, the binding of the antibody, oligopeptide or organic molecule to the protein and causing an inhibition of growth of the cell. Also described is a method for treating or preventing a cell proliferative disorder associated with archaed expression or activity of a protein having at least 80 % amino acid sequence identity to: a polypeptide having any of SEQ ID NO: 2, 8, 10, 12, 16, 20, 22, 49 and 51; a polypeptide having the amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inhibiting the growth of a cell that expresses a protein by contacting the cell with anti-tumor antigens of hematopoietic origin (TAHO) polypeptide, antibody or organic molecule, useful for treating hematopoietic and malignant tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cytostatic; gene therapy; therapy; cell growth; protein purification; DNA purification; hyperproliferation; neoplasm; tumor antigen of hematopoietic origin; TAH023.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The specification describes polypeptides that bind April or BAFF. The polypeptides inhibit APRIL or BAFF binding to B-cell maturation antigen (BCMA). APRIL and BAFF are tumor necrosis family (TNF) members. The polypeptides of the invention are useful for treating immune-related diseases, such as rheumatoid arthritis, multiple sclerosis, and systemic lupus erythematosus; cancer such as leukemia, lymphoma, or multiple scleroma; or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and inflammation. The present sequence
sequence of (a), lacking its associated signal peptide; an extracellular domain of the polypeptide having the amino acid sequence of (a), with or without its associated signal peptide; a polypeptide encoded by any of SEQ ID NO: 1, 7, 9, 11, 15, 19, 21, 48 and 50; or a polypeptide encoded by the full-length coding region of the nucleotide sequence of (d), comprising administering to a subject in need of such treatment an antagonist of the protein, and effectively treating or preventing the cell proliferative disorder. Also disclosed are anti-tumor antigens of hematopoietic origin (TAMO) polypeptides, encoding nucleic acids, the invention. The methods and compositions of the present invention are useful for treating hematopoietic and malignant tumors in mammals. This is the amino acid sequence of tumor antigen of hematopoietic origin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                APRIL; BAFF; immune disorder; immunomodulator; antiinflammatory; cancer; cytostatic; neoplasm; immunosuppressive; therapeutic; BCMA; B-cell maturation antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polypeptides that inhibit APRIL and/or BAFF binding to BCMA, useful for treating immune-related disease, cancer or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and inflammation.

The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (BCMA) activity in a mammal. The method comprises administering a specific binding partner for APRIL (GT0, a tumour necrosis factor-TNF family ligand), having the consensus region of TACI, BCMA, or the TACI/BCMA extracellular consensus sequence, but not the extracellular region of TACI or BCMA. The method is useful for inhibiting activity of TACI and/or BCMA in amammal which is useful for inhibiting activity of TACI and/or BCMA in amammal which is useful for inhibiting activity of TACI and/or BCMA in amammal which is useful for inhibiting activity of TACI and/or BCMA in amammal which is useful for inhibiting activity of TACI antagonists are useful for treating inflammation and immune function diseases such as diarrhoea, psoriasis, allergies, pneumonia, atopic atsaces such as diarrhoea, psoriasis, allergies, pneumonia, atopic disease, drug and insect sting allergy, inflammatory bowel disease (Crohn's disease, colitis), scleroderma, autoimmune disease (multiple sclerosis, rheumatoid arthritis, systemic lupus erythematosus), fungal, bacterial, protozoal and viral infections (HIV), atherosclerosis, cancer with leucocyte infiltration of the skin or organs. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to the use of a BAFF receptor (BAFF-R, also known respection or a BAFF-R fusion protein as an agent for the treatment of a variety of immune-related disorders. BAFF-R is a member of the TAFF (tumour necrosis factor) family, acting as an immunozegulatory agent, and also plays a role in the development of hypertension and related disorders. BAFF-R, fusion proteins containing it, and BAFF-R-specific antibodies can be used for inhibiting B-cell growth, dendritic cell-induced B-cell growth and maturation, and immunoglobulin production,
                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Inhibiting dendritic cell-induced B-cell growth, maturation and B-cell lympho-proliferative disorder by administering BAFF-receptor polypeptide, chimeric molecule comprising receptor or anti-BAFF-R antibody homolog.
                                                                                                                                                                                                                                                                                                            Human BAFF-R; BAFF receptor; TNF family; immunoregulatory agent; immune-related disorder; B-cell growth inhibitor;

c and in the treatment of autoimmune disorders, B-cell lymphoproliferative disorders, hypertension and renal disorders. The BAFF-R proteins may also be used in the treatment of immunosuppressive disorders and HIV confiction, and in patients undergoing organ transplantation. The BAFF-R proteins or BAFF-R specific antibodies may be used for treating, conteins or BAFF-R specific antibodies may be used for treating. Since BAFF-R suppressing or altering an immune response involving a signalling pathway conteins or BAFF-R and BAFF-R thereby inhibiting inflammation. Since BAFF-R inhibits B-cell growth and maturation it is useful for treating diseases such as systemic lupus erythematosus, autoimmune haemolytic anaemia, cach as systemic lupus erythematosus, autoimmune haemolytic anaemia, crapidly progressive glomerulonomburitis, and lymphomas. Nucleic acids encoding chance may research in Berapy to treat tumours, lymphomas, cutoimmune disorders and inherited B-cell-associated disorders. The comparising a mouse IgG-kappa signal sequence, residues 1-153 of human constrains a human IgG-Rappa signal sequence, residues 1-153 of human constrains a human IgG-Rappa signal sequence, residues 1-153 of human constrains a human IgG-Rappa signal sequence, residues 1-153 of human constrains a human IgG-Rappa signal sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; A Proliferation Inducing Ligand Receptor; APRIL-R; cytostatic; gene therapy; cancer; nephrotropic; renal disorder; autoimmune disease; carcinoma; lung; colon; breast; prostate; Grave's disease; hypertension; systemic lupus erythematosus; SLE; inflammation; cardiovascular disease; B-cell lympho-proliferative disorder; BCM; immunosuppressive disease; organ transplantation; HIV; human immunodeficiency virus; TNF; mutine; tumour necrosis factor; B cell maturation protein; BCMA; fusion protein; immunoglobulin G; IgG; Pc region.

                                                                                                                                                                                                                                                                                         interaction between ARRIL and its cognate receptor(8). This method is useful for treating undesired cell proliferation such as cancer or carcinoma, approach and its cognate receptor(8). This method is useful for treating undesired cell proliferation such as cancer or carcinoma, and other carcinoma, colon carcinoma, breast carcinoma, disease, estemic lupus erythematosus-SLB); hypertension, cardiovascular disease, renal disorders, B-cell lympho-proliferative disorders, immunosuppressive diseases, organ transplantation, inflammation and human immune response involving a signalling pathway between ARRIL-R and its ligand. APRIL-R DNA is also useful in gene therapy. The present sequence is a fusion construct containing human APRIL-R also referred as BCMA or sequence from murine Ig kappa cDNA. (Updated on 11-SEP-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                             Treating a mammal for a condition associated with undesired cell proliferation such as cancer or carcinoma, comprises administering a composition comprising A Proliferation Inducing Ligand Receptor (APRIL-R)
                                                                                                                                                                                                                                The invention relates to a method of treating a mammal for a condition associated with undesired cell proliferation such as cancer or carcinoma. The method involves administering a composition comprising A Proliferation Inducing Ligand Receptor (APRIL-R) also referred as B cell maturation protein (ECM or ECMA) antagonist that antagonises the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    human, neurodegenerative immunological disorder; demyelination;

```
The invention relates to a novel method for treating a neurodegenerative immunological disorder, demyelination or Central Nervous System (CNS) inflammation in a mammal. The method comprises administering B-cell maturation antigen (BCMA), or an antibody against BCMA or a BCMA ligand (the mammal has or is at risk of developing multiple sclerosis). The method of the invention has neuroprotective, nootropic, and antiinflammatory activity, and may have a use in gene therapy. The methods, BCMA, and antibodies are useful for treating a neurodegenerative immunological disorder such as multiple sclerosis, demyelination or CNS inflammation. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             APRIL; BAFP; immune disorder; immunomodulator; antiinflammatory; cancer; cytostatic; neoplasm; immunosuppressive; therapeutic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Treating a neurodegenerative immunological disorder, e.g. demyelination or inflammation in a mammal comprises administering a B-cell maturation antigen (BCMA), an antibody against BCMA or a BCMA ligand.

                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                           ö
                                                                                                                             The specification describes polypeptides that bind April or BAFF. The polypeptides inhibit APRIL or BAFF binding to B-cell maturation antigen (BCMA). APRIL and BAFF are tumor necrosis family (TNF) members. The dolypeptides of the invention are useful for treating immune-related diseases, such as rheumatoid arthritis, multiple sclerosis, and systemic lupus erythematosus; cancer such as leukemia, lymphoma, or multiple scleromi; or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and inflammation. The present sequence represents a polypeptide of the invention, derived from formula II (see AEC02021), that that bind BAFF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    APRIL; BAFF; immune disorder; immunomodulator; antiinflammatory; cancer; cytostatic; neoplasm; immunosuppressive; therapeutic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The specification describes polypeptides that bind April or BAFF. The polypeptides inhibit APRIL or BAFF binding to B-cell maturation antigen (BCWA). APRIL and BAFF are tumor necrosis family (TNF) members The polypeptides of the invention are useful for treating immune-related diseases, such as rheumatoid arthritis, multiple sclerosis, and systemic lupus erythematosus; cancer such as leukemia, lymphoma, or multiple scleromis or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and inflammation. The present sequence represents a polypeptide of the invention, derived from formula II (see ABC02021), that that bind BAFF.
